# Problem Statement

Video-based facial expression recognition aims to classify a video into one of seven basic emotions, i.e anger, contempt, disgust, fear, happiness, sadness, and surprise.

- Input
  - Video clip
- Output
  - One of seven expression classes i.e anger, contempt, disgust, fear, happiness, sadness, and surprise.

ocirlan

# Dataset

# Extended Cohn-Kanade (CK+) dataset

## Video Examples

- 593 video sequence
- 123 different subjects

## Frame

- 30 FPS
- 640x490 pixels

# Data Preparation

- Cropped faces from frames
- We have divided each video into 3 segments
- Randomly select one frame from each segment
- Create a stack of those selected frames
- Resize frames into 224x224 size and pass it as input

# Methodology

# Video

- Spatial Information
- Temporal Information

# The Modules

01

## deep CNN

We have used ResNet-18 as a deep CNN module.

02

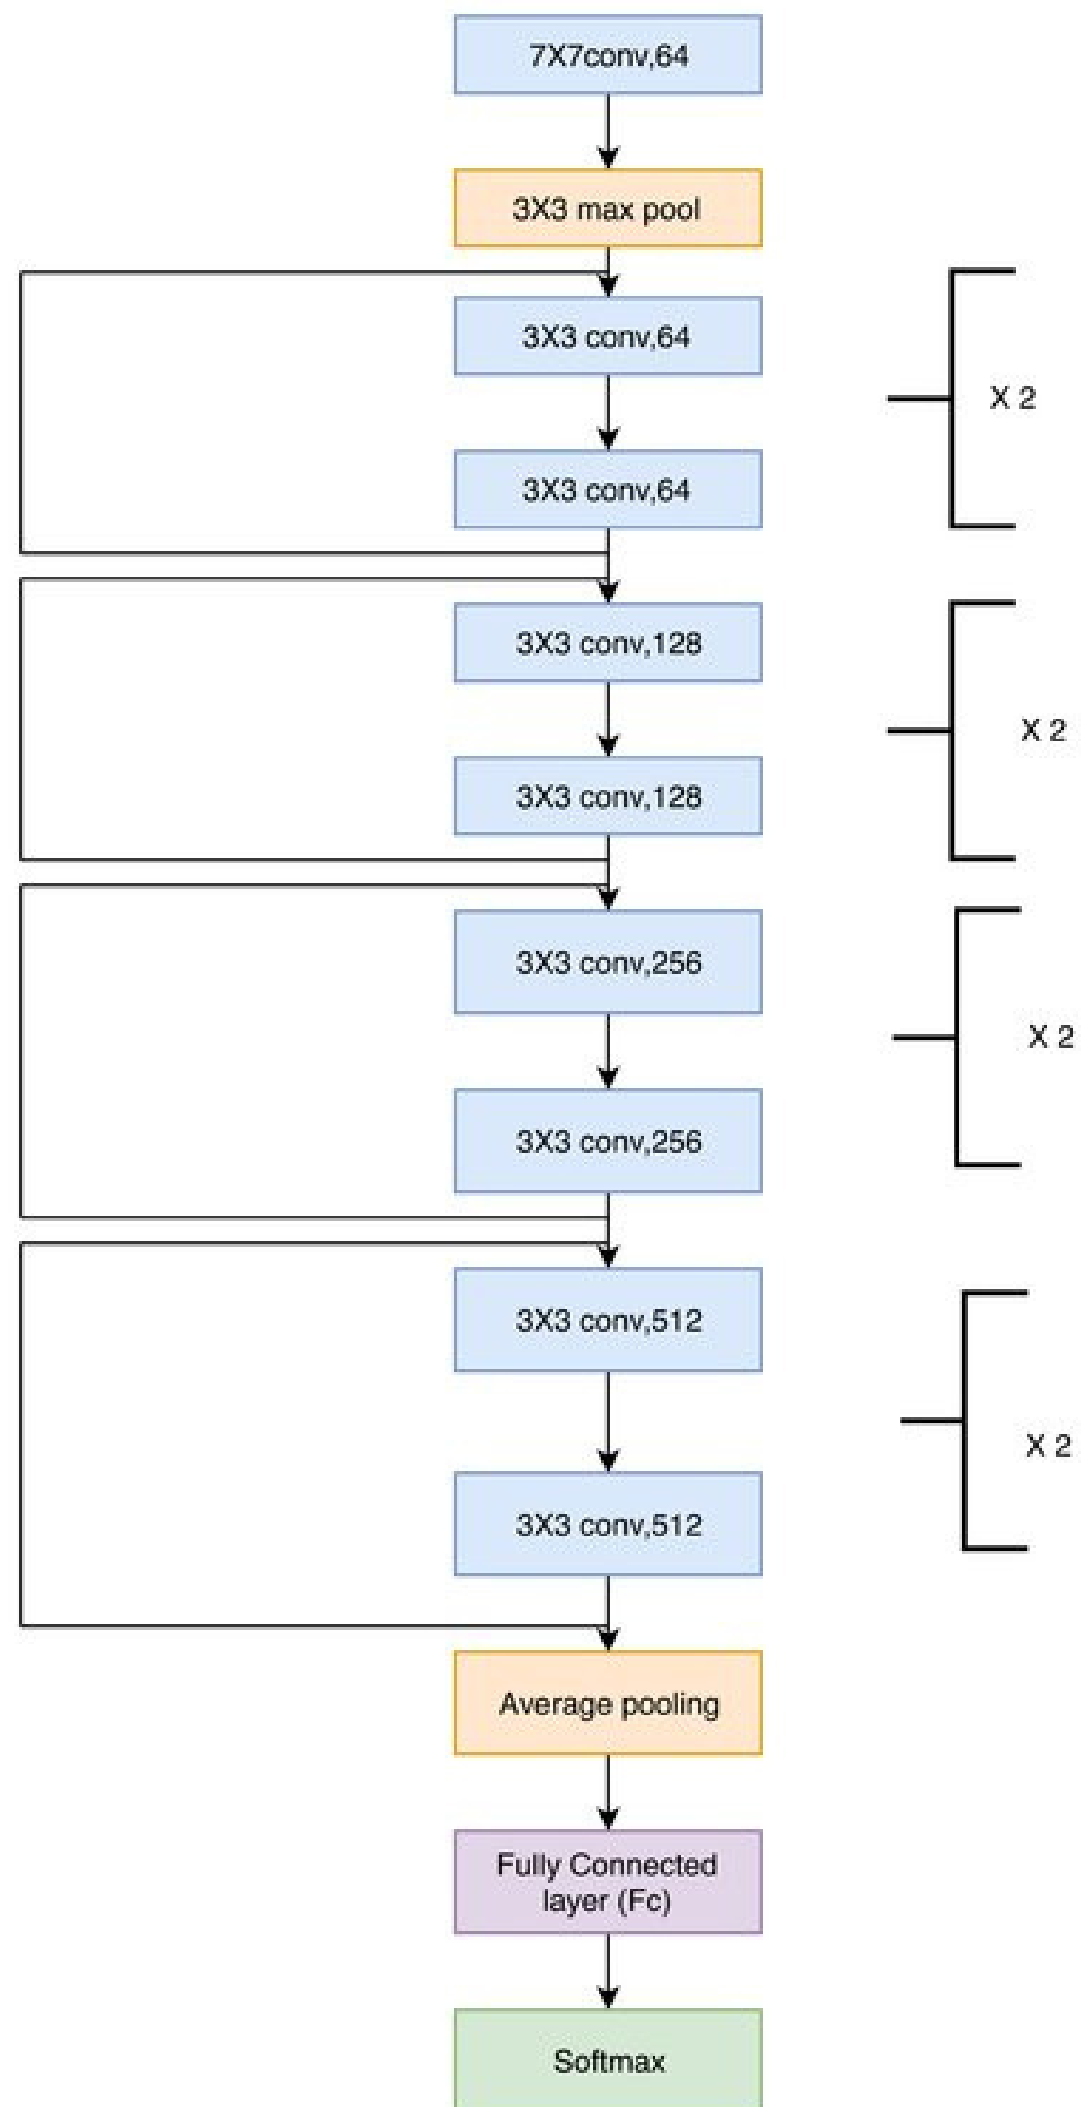

## PAN

Persistent Appearance Network is used to capture temporal information.

03

## Frame-Attention

To assign attention weights to frame of the video.

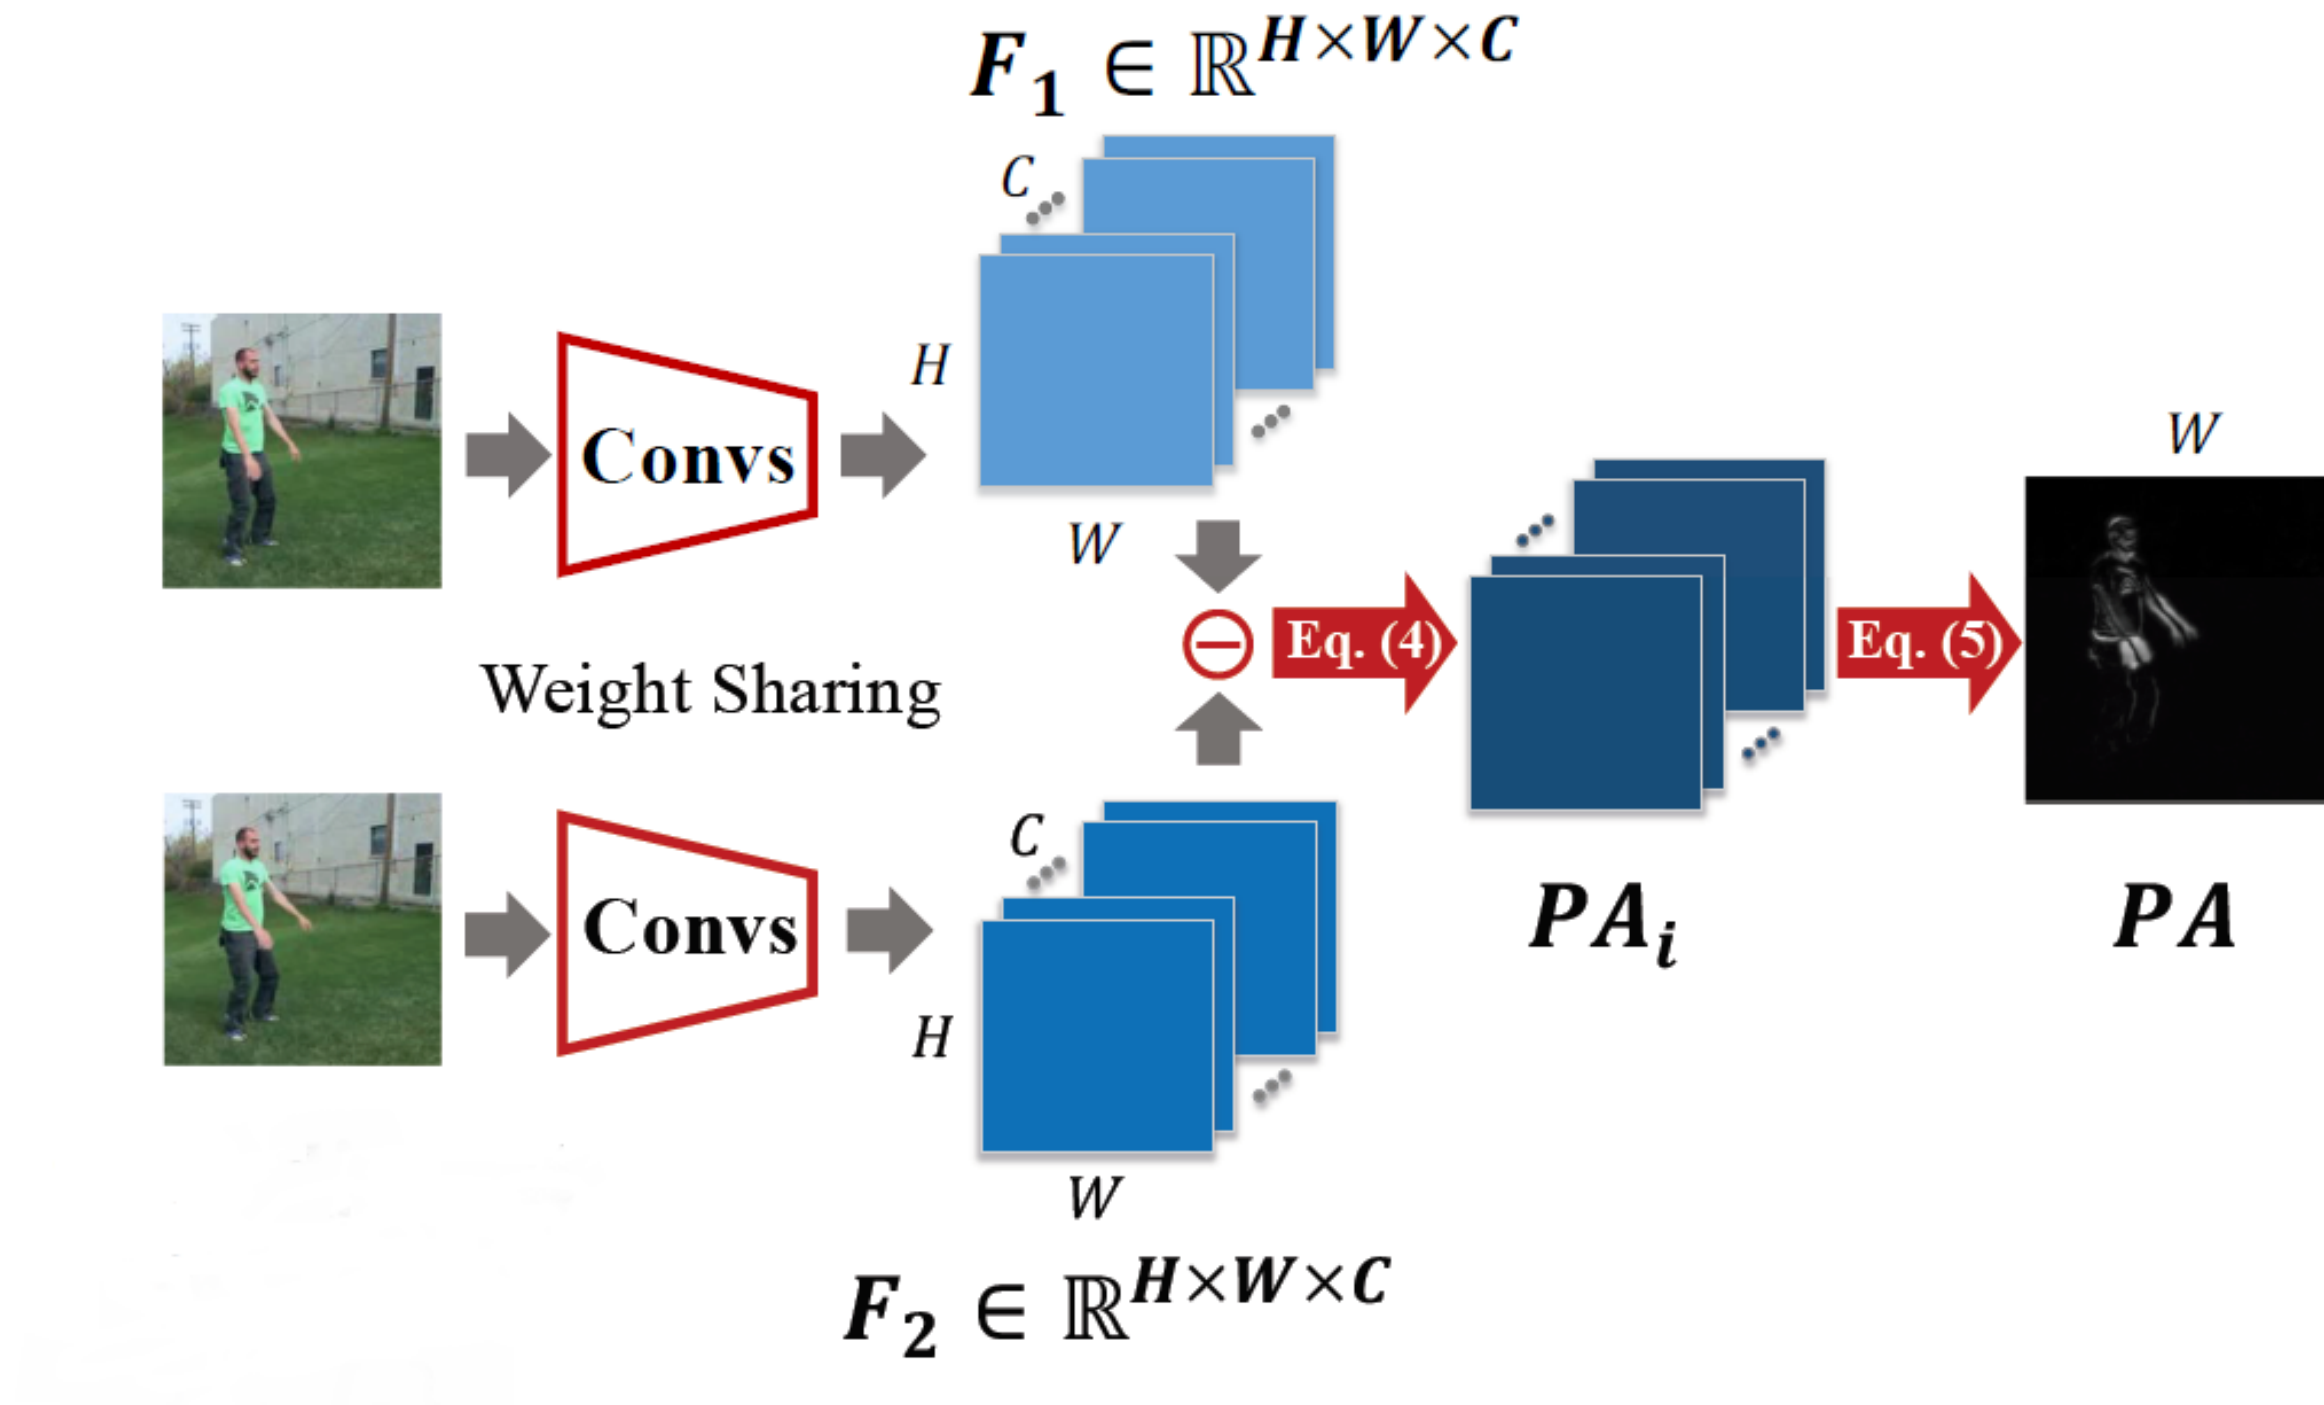

# ResNet-18

- Deep
- High Accuracy
- Advantage of residual block

# PAN

## Persistent Appearance Network

- PAN can model small displacements between frames.
- In FER, small displacements are mouth, forehead and eye's displacement.

# Frame-Attention

- Assign attention weights to the frames
- Generate a global feature vector  $f'_v$
- Creates a final feature vector  $f_v$

# Final Model

Input

Output

# Transfer Learning

- We have used a ResNet-18 model which was pre-trained on the FER+ dataset.
- In our model, we trained Frame-attention network and PAN from scratch.

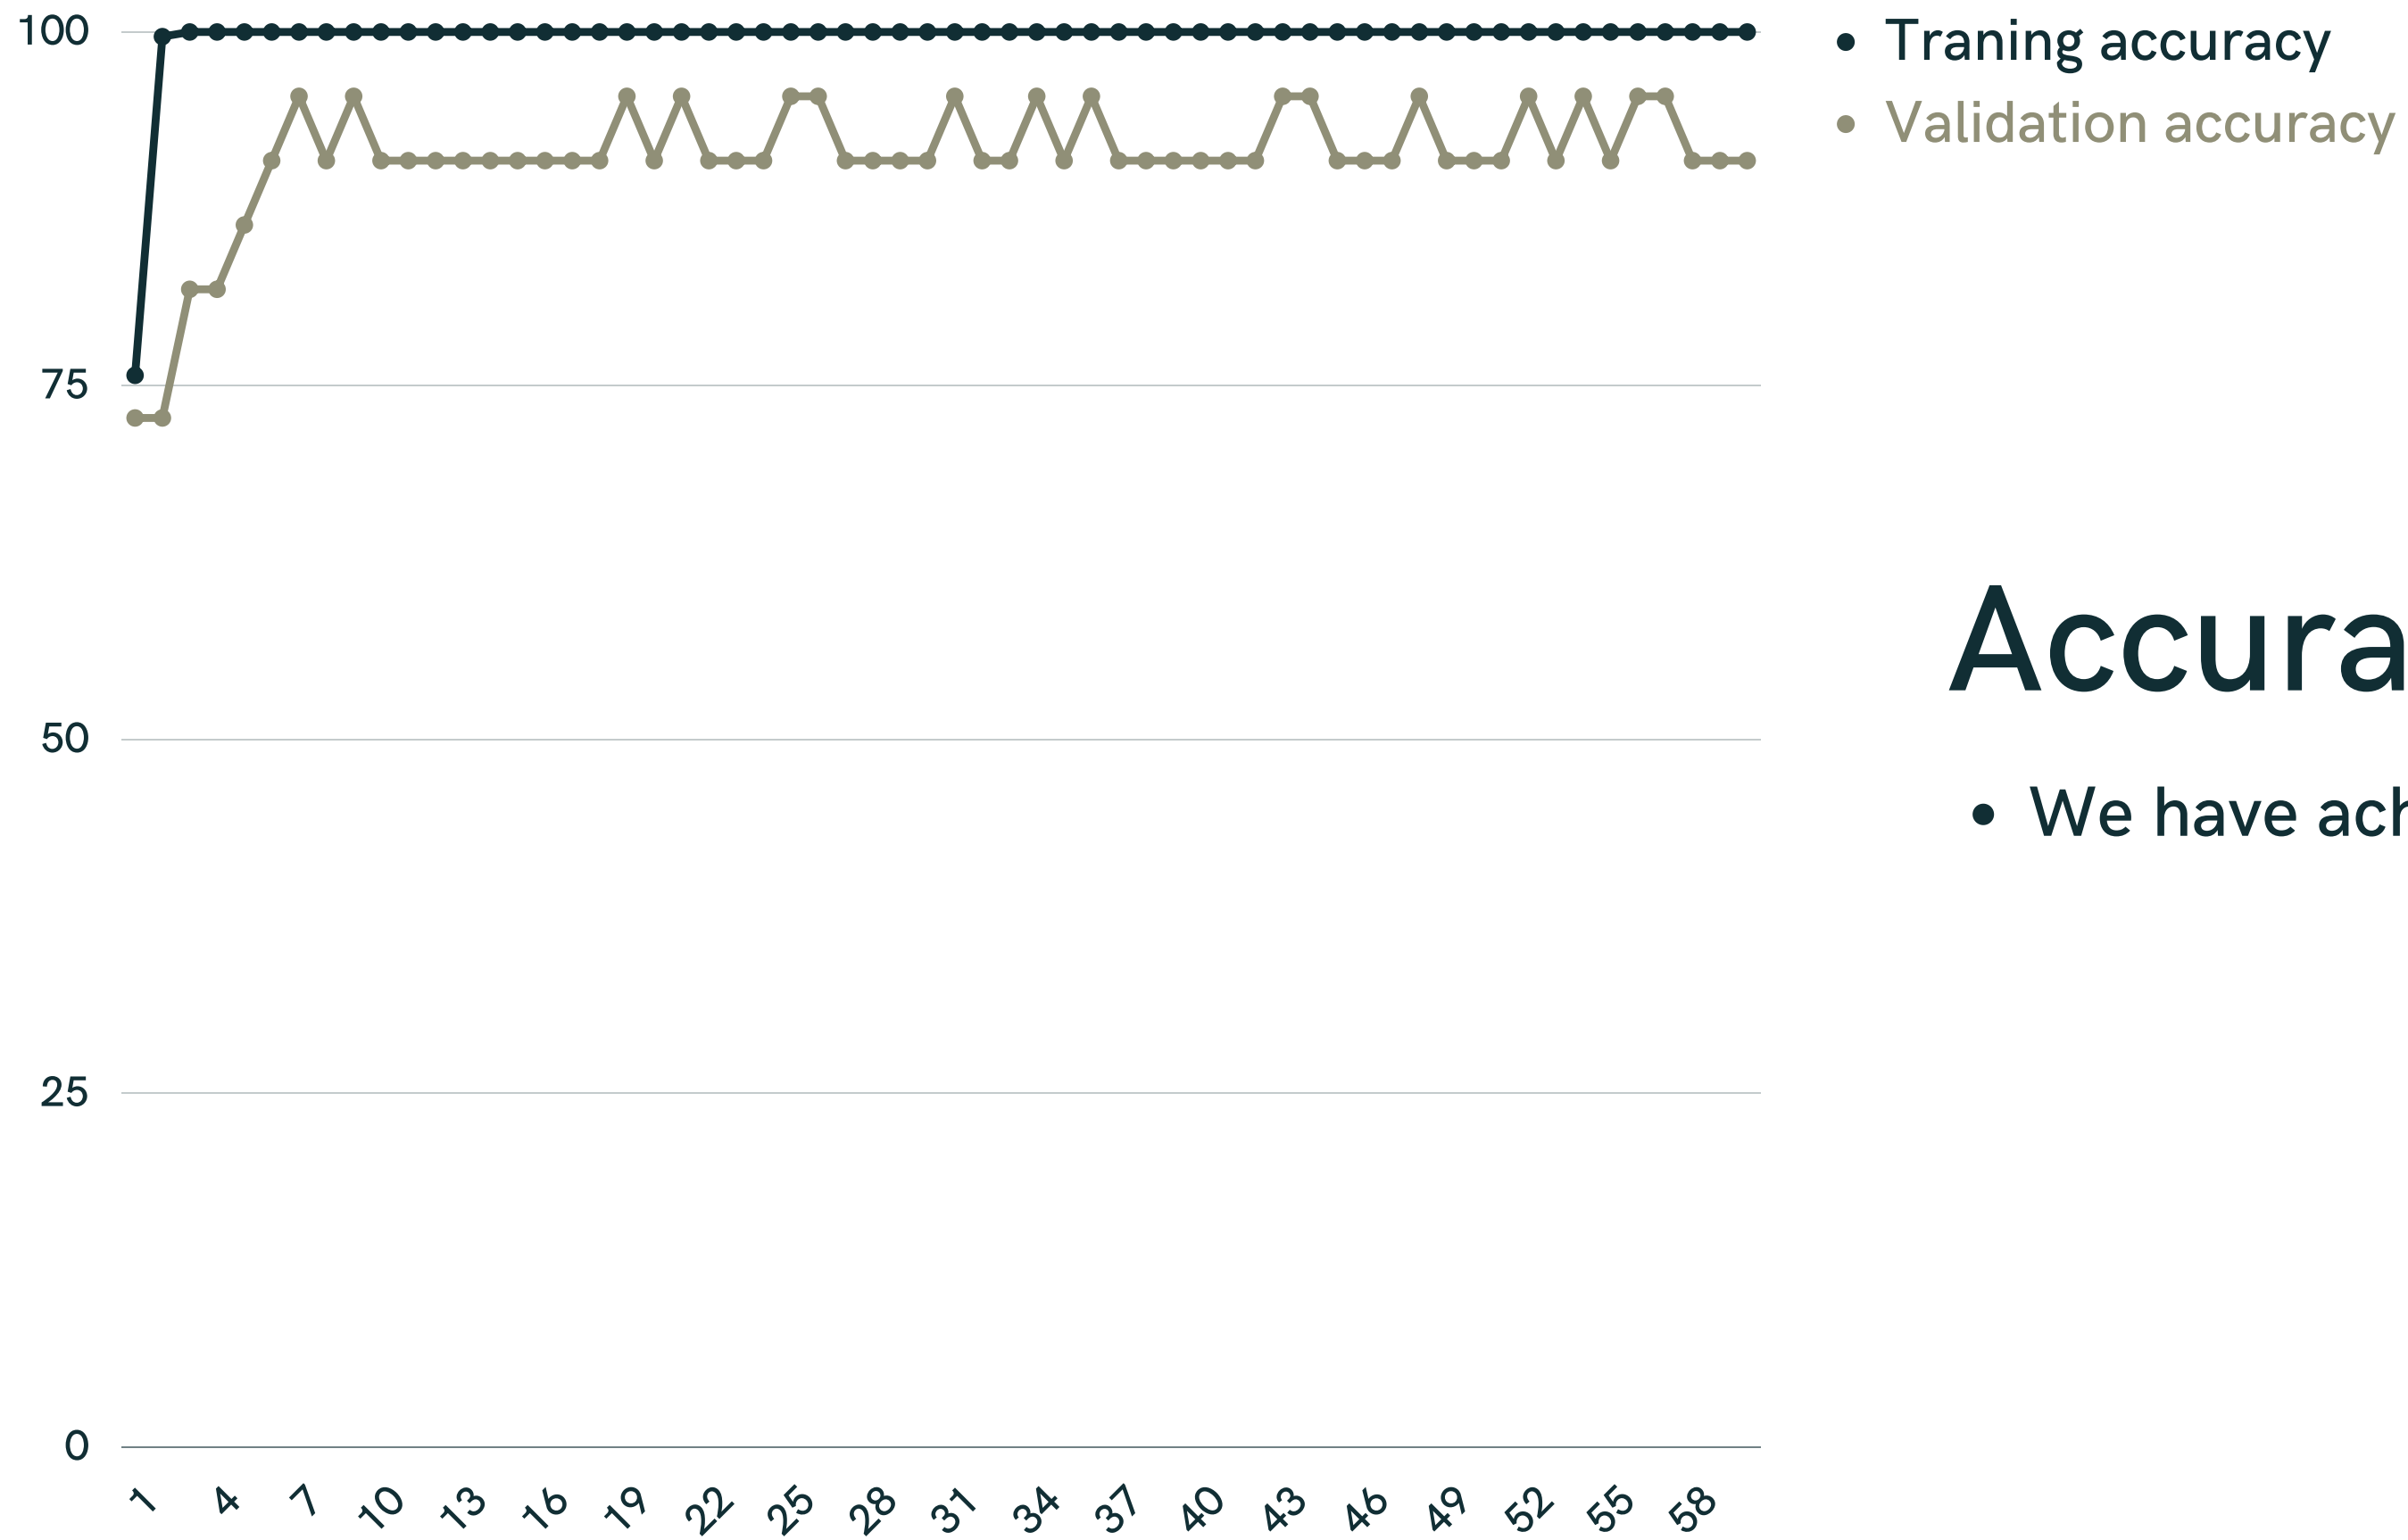

# Optimizer and Hyperparameters

- SGD optimizer with momentum
- Learning rate - 0.02
- Epochs - 60
- Batch size - 48

# Results

# Accuracy

- We have achieved accuracy of 95.455

# Cross Entropy Loss

# Project : Facial Expression Recognition

## Expression Recognition

Final Result
